## CALCULUS JOURNAL

## CURVE SKETCHING

1. (a) The $\qquad$ derivative determines where a graph is concave up and down while the ___ derivative determines where a graph is increasing \& decreasing.
2. (a) Two ways to find critical points are $\qquad$ or by $\qquad$ .
(b) Points found by the second method of (a) are called $\qquad$
(c) On a graph, critical points are usually located at $\qquad$ .
(d) On a graph inflection points are found by $\qquad$ and are located where $\qquad$ .
3. (a) High or low points on a curve, compared to the points on either side of them, are called $\qquad$
$\qquad$ or $\qquad$ extrema.
(b) The highest and lowest points on a curve are called $\qquad$ .
4. How is the curve sketching process influenced by a function that has vertical asymptotes?
5. (a) Relative extrema can be found without graphing the function by using the $\qquad$ and $\qquad$ tests.
(b) The first derivative test is nicknamed $\qquad$ .
(c) The $\qquad$ derivative test is sometimes inconclusive if $\qquad$
6. (a) On a closed interval, such as $[-9,5]$, you determine whether a critical point is an absolute maximum or minimum by:
1) $\qquad$
2) $\qquad$ .
(b) On an open interval, such as $(-\infty, 6)$, you determine whether a critical point is an absolute maximum or minimum by:
3) $\qquad$
4) 
5) $\qquad$
7. When looking at the graph of the derivative of a function, how do you identify each of the following about the original function?
Critical points $\qquad$
Increasing \& decreasing intervals $\qquad$
Inflection points $\qquad$
Concave up \& down intervals $\qquad$
8. Important Rules, Formulas, Etc.
(a) Mean Value Theorem formula
(b) First Derivative Test steps
(c) Second Derivative Test steps
(d) Methods for identifying asymptotes

Vertical
Horizontal

Slant (Oblique)

Curvilinear

(e) Keystrokes necessary to perform long division in CAS.
